

Legend

-  SFRA Study Area
- Groundwater Flood Risk**
-  Negligible
-  Low
-  Moderate

Notes

GeoSmart's National Groundwater Flood Risk Model provides a preliminary indication of groundwater flood risk on a 5m grid. Risk is ranked according to whether there is an expected chance of groundwater flooding greater than a 1% annual probability of occurrence at a site due to extreme elevated groundwater levels. Areas are given a rating based on a grading system for their risk, from negligible to high.

It should be noted that the map is suitable for general broad-scale assessment of the groundwater flood hazard in an area, but is not explicitly designed for the assessment of flood hazard at the scale of a single property. In high risk areas a site-specific risk assessment for groundwater flooding is recommended to fully inform the likelihood of flooding.
